

CONTOUR

Storyteller Version 3.05

Release Notes

February 4th, 2011

Supported Platform(s):

- Intel based Macs
- PCs w/Win XP, Vista or Win7

Storyteller 3.05 is primarily a quality release intended to fix two issues for the ContourGPS camera.

The first issue relates to proper updates of the AssistNow file. This is a special feature of the ContourGPS camera. This is aiding information that can help the ContourGPS obtain a faster TTF. When the ContourGPS is connected by USB to a PC/Mac with Internet access, the latest AssistNow file will be loaded onto the camera. This will provide useful 'aiding' for up to two weeks. A small bug in the current version of Storyteller can prevent this file from overwriting an existing AssistNow file that is on the camera's microSD card. This has been rectified in this release of Storyteller.

The second issue has to do with GPS movies taken with cameras using firmware version 1.10 or later were playing in Storyteller, but not displaying map data on some machines. This issue has been fixed, and now, any movie with a GPS track should display the map during playback on any machine.

Known Issues:

- Storyteller may crash when switching to full screen on XP or Vista
- Missing play/pause controls when in full screen
- 1080p camera ejection on Mac doesn't remove it properly
- When renaming video file in play mode can't select title
- The program should remember the placement of the map window after it's closed
- Full screen Mode shows blank/black screen if movie was paused in some cases
- Map Window Is Hidden When Info Window is Shown
- Can't change title on failed upload

- Movie Player: Scrubbing is lagging in some cases

- Show helpful error message if movie library directory is inaccessible
- Copy link location puts wrong text on clipboard
- Double clicking the "Import" button will put a movie into the queue twice
- Upload window (when in ST) can be closed without warning. The uploads continue without any indication in the UI.
- Storyteller App crashing issues
